## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1a. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 5/12/06 has been entered.

### ***Claim Rejections - 35 USC § 102***

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-42, 44 and 45 are rejected under 35 U.S.C. 102(b) as being anticipated by Kapusnik et al (US 5,452,839).

Kapusnik et al disclose a welding apparatus and method of welding a stud onto a metal sheet comprising a hand held welding gun (2), a welding gauge (plate with 3 triangular holes and the middle hole for stud insertion), a positioner (4) attached to the gun, wherein the element is a

Art Unit: 1725

metal stud and can be welded to a metal sheet. The alignment feature is the welding gauge as shown in figure 1. The alignment feature is the hole or the pin on the welding gauge or the gun as shown in figure 1. The hole is adjustable, the positioner can be moved relative to the hole. The gauge has three alignment features. The positioner is inserted into the hole as shown in figure 1. The alignment feature are placed in a triangle pattern around the element (figure 1). In arc welding process, it is conventional and inherent to create an arc by lifting the element from the component to create an electric arc, then turning on the welding current, followed by lowering the element onto the component to mingle the molten material, and then solidify the combined molten metal material to weld.

### *Response to Arguments*

3. Applicant's arguments with respect to claims 1-42 and new claims 44-45 have been considered but are moot in view of the new ground(s) of rejection.

Applicant argues that Kapusnik et al fail to teach the new amendment, including an elongated positioner having a flat bottom surface. Applicant further argues that Kapusnik et al only disclose a hemispherical configuration of the positioner. Examiner respectfully disagrees. The positioner is reference number 4 shown in Kapusnik et al. At the end of the positioner, it is substantially flat since it is screwed to a nut. Reference number 24 is a receiver on the gauge #10 to receive the positioner #4. Therefore, the new amendment does not overcome the prior art of record.
